SUMMARY

Backend engineer with hands-on production experience shipping systems solo: authentication, caching, event pipelines, and LLM-integrated automation. Built and deployed three live systems: a P2P payment wallet with idempotent transfers, a Kafka-based telemetry pipeline sustaining 50-200 events/sec on free-tier infrastructure, and a full agency operations platform with automated AI-driven lead outreach. Seeking a full-time backend engineering role where system design and correctness are taken seriously.

TECHNICAL SKILLS

- **Backend & Frameworks:** Python · FastAPI · Flask · Uvicorn
- **Databases:** PostgreSQL (NeonDB) · MongoDB · Redis
- **Infra & DevOps:** Docker · AWS · GCP · Git/GitHub · CI/CD (GitHub Actions)
- **Backend Concepts:** JWT Auth · Idempotency · Caching · Circuit Breakers · REST API Design · Async Programming
- **AI Integration & Automation:** LLM pipeline design (Claude, Gemini) · n8n workflow automation

EXPERIENCE

Backend Engineer, Internship, GameGenesis

Jan 2025 - Mar 2025

Owned all technical decisions, architecture, and production systems end to end at an early-stage startup.

- Engineered and scaled core backend services and CRM architecture from scratch using FastAPI, PostgreSQL/Neon, Redis, and CI/CD via GitHub Actions.
- Integrated LLM pipelines (Claude, Gemini) directly into the CRM, automating workflows that previously required manual handling.
- Built an employee management module to track contribution value per team member, used directly for resourcing decisions.
- Maintained all production systems with zero downtime across the full internship period.

PROJECTS

Apex Ledger: Secure P2P Payment Wallet | [GitHub](#) | [Live](#)

Python | FastAPI | PostgreSQL (NeonDB) | Redis | JWT | Docker | pytest | GitHub Actions

- Built a P2P payment wallet supporting user registration, login, and real-time balance transfers with automatic fee calculation and atomic balance updates.
- Implemented stateless JWT authentication via HTTP-only cookies; sender identity is always resolved server-side from the token, never from user input, preventing spoofing.
- Added Redis idempotency keys (300s TTL) to prevent duplicate transfers from double-clicks, plus balance caching (60s TTL) with circuit breaker fallback.
- Containerized with Docker and configured a full pytest suite running on every push via GitHub Actions.

Gen Argus: Real-Time Telemetry Pipeline | [GitHub](#) | [Live](#)

Flask | Apache Kafka | PostgreSQL (NeonDB) | Pydantic | SQLAlchemy | Docker | Aiven | Render

- Built a telemetry pipeline ingesting events from any client into Kafka, batch-flushing to PostgreSQL every 1,000 records or 2 seconds.
- Placed Kafka between API and database to absorb ingestion spikes; sustained 50-200 events/sec on free-tier infrastructure.
- Enforced API key auth on ingestion endpoints and Pydantic schema validation with 422 responses for invalid payloads; live dashboard polls every 3s via Chart.js.
- Deployed as a web service and background worker on Render with Aiven-managed Kafka in production.

Arashi OPS: Agency Operations Platform | [GitHub](#) | [Live](#)

Next.js | PostgreSQL (NeonDB) | JWT | n8n | Jina AI | Google Gemini | Claude | Vercel

- Built a full agency operating system: an admin command center covering client tracking, deals, proposals, invoicing, and AI lead scoring, plus a client portal for onboarding, deliverables, and billing.
- Designed the PostgreSQL schema and implemented secure stateless JWT authentication with environment-isolated configuration across both portals.
- Automated outreach via n8n: ingests an Apollo CSV, filters unprocessed leads, scrapes company sites via Jina AI, generates personalized emails with Gemini/Claude, and writes deduplicated results to Sheets and DB.

EDUCATION

B.Sc. Information Technology, Techno India University, Kolkata

Graduating 2026
